Sharing Wrapper classes

Hence, we can say that vector has a number of advantages over arrays.

- It is convenient to use vectors to store objects.
- A vector can be used to store a list of object that may vary in size.
- We can add and delete objects form the list as and when required.

Vector supports a number of methods that can be used to manipulate the vector.

- Add element (item)
- ElementAt (n)
- size ()
- remove element (item)
- remove ElementAt (n)
- remove All Elements
- copy into (array)
- Insert ElementAt (item, n).

addElement (item)

Adds the item specified to the list at the ad. "item" must be of object type.
