4. Stopped/blocked stage
5. Dead stage.

Sharing THREAD LIFE C... ▾

New born stage

When we create a thread object, the thread is born and is said to be in 'newborn' state. In this stage, the thread is not scheduled for running. At this state, we can do only one of the following.

- a. Schedule it for running using start () method.
- b. Kill it using stop () method

The Runnable state means that the thread is ready for execution and is waiting for the availability
