

Networking

Networking is interlinking of more than one computer or electronic device to share computing resources. these are three types of computing resources that are shared i) voice ii) video iii) Data

Components of networking

Modulator :-

It convert sound energy into its analogous form such as electrical, electronic, etc. so that it can be carried along the medium by a carrier.

Medium :- It provide the path on which analogs signal travels.
for ex = when we are taking, air is the medium. Similarly while taking on land line, wire is the medium.

* Medium is must for any networking

Demodulator :- It converts sound analog signal like electrical or electronic back into sound form.
